

An Open Letter to the Government of Ontario

Ontario Power Generation's Plan to Bury Nuclear Waste in Deep Underground Caverns Beside Lake Huron Must be Set Aside

Dear Premier Wynne and Members of the Ontario Legislature:

Last week, a panel appointed by the federal Minister of the Environment and the Canadian Nuclear Safety Commission in 2012 provided the Minister with its final report on the review of Ontario Power Generation's proposed Deep Geologic Repository for Low and Intermediate Level Radioactive Wastes. The Joint Review Panel (JRP) recommended that the federal minister approve the proposed repository, despite the expert evidence they heard throughout the public hearings about numerous technical uncertainties, and in the face of large and growing public opposition. The JRP conclusions are flawed.

We are writing to the Government of Ontario, as the sole shareholder of the proponent, Ontario Power Generation, to request that Ontario Power Generation (OPG) be directed to withdraw its proposal and that the Government of Ontario initiate a needs assessment with respect to the storage and management of low, intermediate and high level radioactive wastes at OPG owned and/or operated reactors.

In brief, Ontario Power Generation is proposing to construct a series of caverns 680 metres below-surface in a band of limestone, and to transfer into those caverns 200,000 cubic metres of nuclear waste. Some of these wastes – called “low level” radioactive wastes – do not require extra barriers to shield workers from radioactivity, although they are still hazardous. Other wastes, classified as “intermediate” wastes are highly radioactive. In fact, intermediate waste is almost as radioactive as “high level waste” and as recently as 2002 was identified as Type III waste, with similar radioactivity to used fuel or irradiated nuclear fuel waste. Elements of these wastes will remain dangerously radioactive for hundreds of thousands of years, and some for even far longer than that.

At the end of a nine year review the proposed DGR project has too many unknowns. For example:

- Ontario Power Generation's characterization and inventory of the wastes remains incomplete.
- The rate at which gas will be generated by deteriorating metal waste containers is still unknown; this is important, because these gas pressures can cause fracturing that could speed the release of radionuclides out to the biosphere.
- The chemical stability of some wastes, such as ion exchange resins, is uncertain over time.
- Many of the “design” decisions have not yet been made, including important features like the seal for the vertical shafts that connect the underground repository to the environment.

However, many things that are known about the Project cause concern, such as:

- The only example Ontario Power Generation offered of a similar deep geologic repository for radioactive wastes, the Waste Isolation Pilot Plant in New Mexico, is no longer operating after an underground fire and loss of containment resulted in radioactive releases to the surface in 2014.

- Management of the wastes through placement in the proposed DGR will cost approximately four times more than above-ground options, with current cost estimates at over \$2 billion; OPG's pattern of persistently underestimating costs for nuclear projects over the last several decades suggests that real costs are more likely to be in the \$6 to \$10 billion range.
- Ontario Power Generation's proposal (2011) is for 200,000 metres³ but in August 2013 Ontario Power Generation acknowledged on the public record that they intend to double the amount of waste to be placed in the proposed DGR and will seek a licence amendment after they receive a project approval based on the original volume; the final use and size of the proposed DGR remain unknown.
- 154 municipalities representing more than 20 million people have passed resolutions opposing OPG's proposed waste repository; the large and growing public opposition includes many elected representatives in the U.S.
- This project is an unacceptable risk to the world's largest fresh water supply: the Great Lakes.

During 33 days of hearings in 2013 and 2014 it became abundantly clear that Ontario Power Generation's proposal was still very much in flux. It also became apparent that the Canadian Nuclear Safety Commission (CNSC) staff, who were attending the hearings daily, were operating as advocates rather than impartial assessors of Ontario Power Generation's incomplete proposal. CNSC staff repeatedly told the Review Panel that key decisions could be left until after an approval was issued by the Joint Review Panel, and the CNSC staff themselves would become the decision-makers.

The Joint Review Panel's 450 page report does a reasonable job of acknowledging the myriad issues raised through written submissions and hearing testimony by members of the public, independent experts, Saugeen Ojibway Nation, and the Panel's own experts. What is unreasonable is the Panel's complete dismissal of many of these issues, and the deferring of other issues to a future decision-maker. Simply leaving them unresolved – while recommending project approval – is unreasonable and concerning. In addition, the Panel report is flawed by internal contradictions and overly generalized statements which are not supported by the hearing record.

As the Joint Review Panel notes in the opening pages of its report, this Project is without precedent anywhere in the world. It is also an exercise in contradiction, as is the JRP report itself. For example:

- Ontario Power Generation argued that the repository is needed to remove the wastes from the surface and keep them "safe" from threats such as terror attacks or social collapse, yet Ontario Power Generation also contends that the wastes are safe at their present above-ground location, and continues to generate more and more of such wastes, including highly radioactive spent fuel which will have to remain on surface for decades due to heat and radiation levels.
- The Joint Review Panel contends that the proposed site was preferred above others primarily because it would avoid risks associated with further transportation, yet the wastes from the Darlington and Pickering generating stations continue to be transported long distances to the Western Waste Management Facility, adjacent to the proposed site of the repository.
- The Joint Review Panel recommends in their report that "OPG should minimize the volume of waste stored in the DGR" but in the same report states that doubling the volume of waste (with the addition of decommissioning waste) would not change project outcomes.
- The Joint Review Panel acknowledges that there are uncertainties related to many technical aspects of the project but asserts that these same aspects, in combination, provide confidence in the Project.

The evidence presented to the Joint Review Panel by expert consultants retained by the Review Panel, by independent scientists and engineers, and by other hearing participants establish that the project's proposed design and site geology is **uncertain**, the project is **unacceptable** to the public and the residents of the Great Lakes basin, the project is **unnecessary** for the management of the wastes, and **unaffordable** from a cost-benefit perspective.

The federal government may accept a flawed project, approved through a flawed review. The Provincial Government should not follow suit.

The undersigned organizations urge you as the sole shareholder of OPG to:

- Direct Ontario Power Generation to withdraw its proposal to bury nuclear waste beside Lake Huron, and
- Direct the Minister of Environment and Climate Change and the Minister of Energy jointly to convene an expert and citizens' advisory panel to conduct a needs assessment with respect to the storage and management of low, intermediate and high level radioactive wastes at OPG owned and/or operated reactors.

Respectfully submitted on May 14th, 2015 by the undersigned organizations:
